

Birol Yeşiloğlu

Software Engineer · Games · Unity / C#

Antalya, Türkiye (open to relocation to Istanbul) | birolyesiloglu2002@hotmail.com

linkedin.com/in/birol-yeşiloğlu | github.com/BirolYesiloglu | Link It on Google Play

Summary

Computer Engineering graduate who shipped a mobile puzzle game as a solo developer, focused on clean, testable object-oriented architecture and algorithmic problem solving. Also experienced with Java/Spring Boot backends.

Experience

Software Engineer (Independent)

Apr 2026 – Present

Beem Studios

Antalya

- Built and shipped **Link It**, a 2D grid-based mobile puzzle game in Unity and C#, as a solo developer. Live on Google Play; iOS release in progress.
- Designed a polymorphic rule engine (`IPointRule`, one class per mechanic) so new mechanics such as ice, portals and water/fire are added without touching core logic; guarded the refactor with regression snapshots across all levels.
- Wrote a level solver using exact-cover backtracking (most-constrained-cell heuristic, node/time limits) that verifies solvability, computes 3-star thresholds and powers in-game hints.
- Built an editor tool that bulk-generates only valid levels, replacing manual level design.
- Wrote 35+ unit tests (NUnit, Unity Test Framework) covering path rules, the shape library and localization.
- Built a generic object pool and applied UI rendering optimizations for low-end Android devices; separated game logic from presentation with an event-driven design.
- Owned the full release: Google Play Console release tracks, rewarded and interstitial ads (AdMob) behind an `IAdService` interface, Firebase Analytics event tracking, in-app update prompts and localization into 7 languages.

Game Developer Intern

July 2024 – August 2024

Skyloft Studios

İzmir

- Developed gameplay, player mechanics and enemy behavior for a five-level mobile first-person shooter prototype in a two-person team (Unity, C#).
- Implemented UI and game logic from design specs; debugged and tested to deliver a stable build (Git).

Projects

TradePath – Graduation Project

2025

Yaşar University, two-person team

- Mobile stock prediction app. Built the backend: REST API in Java Spring Boot, PostgreSQL database and integration of external financial data APIs.

Skills

Languages	C#, Java, SQL, C
Engineering	OOP, SOLID, design patterns (Strategy, Observer, Object Pool), unit testing (NUnit), algorithms & data structures
Game Dev	Unity, mobile (Android, iOS), event-driven architecture, editor tooling
Backend	Spring Boot, REST APIs, PostgreSQL, MySQL
Tools	Git, Google Play Console, Trello
Spoken	Turkish (native), English (B2)

Education

B.Sc. in Computer Engineering · GPA 3.18/4.00

2020 – 2025

Yaşar University · 100% English

İzmir

Leadership

Co-Founder & President

2023 – 2025

Game Development and Animation Student Club, Yaşar University

İzmir

- Founded and led the club; coordinated members' game development projects.
